

WebERP Implementation

WebERP a leading open source ERP platform offers an affordable, modular, configurable solution for small-to-medium sized companies. It is designed for use in situations where a company's needs cannot be satisfied by the use of out-of-the-box software products. WebERP allows organizations to retain those business processes which deliver competitive advantage, and it can be tailored to the exact needs of the business.

Available modules

- Customers, with multiple sites and contacts per customer.
- Products, with up to 3 levels of categorization.
- Customer-specific price lists
- Order-flow, from order-entry, to invoicing.
- Manufacturing, including work-order generation
- Delivery, with customer acknowledgement
- Stock system and purchase orders.
- Invoicing (exports to QuickBooks and other popular accounts packages)

WebERP offers the following features:

- Web-based, so no special software needs to be installed on client PCs, and it is easy to use.
- User interface is configured to the exact needs of the business.
- Work orders, delivery notes, invoices and other documents designed to the company's requirements.
- Flexible security system. Users only see the parts of the system to which they are granted access.
- Runs on existing Microsoft Windows servers.
Customized for your business

Unlike many 'off-the-shelf' software products, which force an organization to change its business processes to fit the software, WebERP is configured around the specific needs of the business.

In deploying a WebERP based solution, we willl:

- Analyze the business,
- Modify existing modules to suit the business's workflow,
- Create additional modules if required,
- Install and commission the software,
- Train users,
- Support the system and its users, both on-site and remotely.
